SMX for different IAC.group

#stop the script - by error

Die Mittelwerte der Resistenz sind für 5 Antibiotika vergleichbar (AMP, MERO, TGC, TAZ, CHL), für GEN tendenziell grösser im Fall *Ill Animals in Calving box*, für 3 Antibiotika tendenziell kleiner in diesem Fall (ZIP, AZI, NAL), für TET definitiv grösser in diesem Fall und für 3 Antibiotika definitiv kleiner in diesem Fall (FOT, TMP, SMX). Diese Relationen sind im wesentlichen gleich gerichtet wie in WM - keine WM.

Der Vergleich des Medians der 2 Gruppen zeigt Unterschiede nur für TET und SMX, in der gleichen Richtung wie der Mittelwert. Deshalb diskutiere ich den Median nicht weiter.

SMX for different OLS.group

#stop the script

Die Mittelwerte der Resistenz sind für MERO, GEN und TAZ vergleichbar, für 5 Antibiotika tendenziell grösser im Fall *Other Livestock* (CIP, FOT, CHL, NAL, SMX), für TGC tendenziell kleiner in diesem Fall und für 4 Antibiotika definitiv kleiner in diesem Fall (AMP, AZI, TET, TMP). Diese Relationen sind im wesentlichen entgegengesetzt zu WM - keine WM!

Waste Milk - Gruppen

```
graphisch("WM.group", "AMP", 1,32, 1,8)
```

```
## [1] "AMP - Resistance, WM      :"
```

```
## [1] "  Median      = 4"

Es ist kein sehr ausgeprägtes Muster für grösste/kleinste Resistenzen zu erkennen. Tendenziell ergeben 1 und 1+2 die grössten Resistenzen, 2 und vor allem 0+1 die kleinsten.

Vollständigkeit

Jetzt sind alle Verteilungen geplottet und deskriptiv analysiert, ausser:

- AMI: alle Proben sensitiv <=4
- COL: alle Proben sensitiv <=1

Weitere Schritte

Technischer Natur

- noch minimale Verbesserungen Verteilungsplots?

Fundamentaler Natur

Kausalitäten studieren mittels Regressionen :

- Kausalitätsgraph
- Lineare Regressionen?
- multivariable logistische Regression ... mixed effects?

- vs Assoziation:
 - Vorlesung Christian: “Kausalität nur wenn immer der Fall”-!?
 - Buch Scutari: ??
