#stop the script - by error
```

Die Mittelwerte der Resistenz sind für 5 Antibiotika vergleichbar (AMP, MERO, TGC, TAZ, CHL), für GEN tendenziell grösser im Fall *Ill Animals in Calving box*, für 3 Antibiotika tendenziell kleiner in diesem Fall (ZIP, AZI, NAL), für TET definitiv grösser in diesem Fall und für 3 Antibiotika definitiv kleiner in diesem Fall (FOT, TMP, SMX). Diese Relationen sind im wesentlichen gleich gerichtet wie in WM - keine WM.

Der Vergleich des Medians der 2 Gruppen zeigt Unterschiede nur für TET und SMX, in der gleichen Richtung wie der Mittelwert. Deshalb diskutiere ich den Median nicht weiter.

Other Live Stock - Gruppen

Die Mittelwerte der Resistenz sind für MERO, GEN und TAZ vergleichbar, für 5 Antibiotika tendenziell grösser im Fall *Other Livestock* (CIP, FOT, CHL, NAL, SMX), für TGC tendenziell kleiner in diesem Fall und für 4 Antibiotika definitiv kleiner in diesem Fall (AMP, AZI, TET, TMP). Diese Relationen sind im wesentlichen entgegengesetzt zu WM - keine WM!

## [1] ""
```

Der Mittelwert ist vergleichbar ohne WM. Genauer: tendenziell höher - das kann man auch noch per Hand kontrollieren: TAZ ist immer ≤ 0.25 ausser für:

- Waste Milk: 0.5 für Betriebe 11 und 15
- Keine Waste Milk: 0.5 für Betriebe 12, 59 und 3*1 für Betrieb 52

(Betrieb 30 wurde ganz am Anfang schon gelöscht)

Die Werte 0.5 balancieren sich also aus für Waste Milk oder nicht, und der Unterschied kommt von den 3 Werten 1: Ohne WM ist resistenter.

```

Es ist kein sehr ausgeprägtes Muster für grösste/kleinste Resistenzen zu erkennen. Tendenziell ergeben 1 und 1+2 die grössten Resistenzen, 2 und vor allem 0+1 die kleinsten.

Vollständigkeit

Jetzt sind alle Verteilungen geplottet und deskriptiv analysiert, ausser:

- AMI: alle Proben sensitiv <=4
- COL: alle Proben sensitiv <=1

Weitere Schritte

Technischer Natur

- noch minimale Verbesserungen Verteilungsplots?

Fundamentaler Natur

Kausalitäten studieren mittels Regressionen :

- Kausalitätsgraph
- Lineare Regressionen?
- multivariable logistische Regression ... mixed effects?

- vs Assoziation:
 - Vorlesung Christian: “Kausalität nur wenn immer der Fall”-!?
 - Buch Scutari: ??
